

Definition of Data Structures used in Foccacia Data Layer

This document outlines the data structures utilized in the Foccacia application's data layer, specifically for handling football-related data. The data structures are designed to facilitate efficient storage, retrieval, and manipulation of information related to football leagues, teams, players, matches, and statistics.

1. User Data Structure

```
{
  username: String,           // Unique identifier for the user
  token: String,              // Universally unique identifier for the user (UUID
                              // format)
  groupAmount: Number         // Number of groups associated with the user
}
```

2. Player Data Structure

```
{
  id: Number,
  name: String,
  teamId: Number,
  teamName: String,
  position: String,
  nationality: String,
  age: Number
}
```

3. Group Data Structure

```
{
  token: String,              // User token associated with the group
  id: Number,                  // Unique identifier for the group
  name: String,                // Name of the group
  description: String,         // Description of the group
  competition: String,         // List of competition ID associated with the group
  year: Number,                // Year of the competition
  players: [Player Data Structure] // Array of Player Data Structures
}
```

4. Player Request Structure

```
{  
  
  id: Number, // id from "player": { ... "id": ... }  
  Name: String, // name from "player": { ... "name": ... }  
  teamId: Number, // id from "code": { ... "id": 59, "name": ... }  
  teamName: String // name  
}
```
